

Access Modifiers in C#

1. protected internal

A member declared as **protected internal** can be accessed:

- By any class in the same assembly (project).
- By derived classes even if they are in another assembly.

Example

```
class Person
{
    protected internal string Name = "Folaan";
}
```

2. private protected

A member declared as **private protected** can be accessed:

- Only by derived classes.
- The derived class must be in the same assembly (project).

Example

```
class Person
{
    private protected string Name = "Folaan";
}
```

```
class Student : Person
{
    public void Show()
    {
        Console.WriteLine(Name);
    }
}
```

}

}
